The Global Supply Chain Management (GSCM) option focuses on one of the most important tasks of a contemporary global company: managing its worldwide supply network, which covers its entire business practice, ranging from its supplier management, manufacturing or service delivering, distribution and marketing, down to its customer relationship management.

The GSCM option teaches students how to perform typical tasks of a supply chain manager, such as: Designing and managing the relationships that keep products moving on the global playing field; planning how products are made and get to market, what materials are used and where they are purchased, how much inventory should be produced, where products are warehoused, and how they are marketed to best satisfy consumer demand. For our students, job opportunities are plentiful in exciting business areas such as retail, business consulting, import/export, logistics, category management, business development, and manufacturing.
